

System Overview

What we built, how it works, where we are

A Saudi-native creative intelligence platform — proprietary real engagement data
fused with cultural methodology — built by OGZ Studios.

1. What it is

OGZ Content Intelligence is a **Saudi-native creative intelligence platform**. It turns thousands of real, verified Saudi Instagram posts into a knowledge base that helps Saudi brands produce better Arabic content — faster, and culturally correct.

The moat, in one line:

Real Saudi engagement data + Saudi cultural intelligence. No competitor can buy this — it is built observation by observation. A foreign tool translating English to Arabic cannot replicate it.

2. Where we are today

Observations	6,888 real Saudi Instagram posts (60 brands, 23 with verified likes)
Templates	5,014 caption templates (3,077 with REAL engagement numbers)
Brain	v4.0 — 18 knowledge sections, 10 Saudi occasions, cultural guardrails
Creative Directors	5 CD-brain methodologies (creative techniques, not generic prompts)
API	21 endpoints on a FastAPI server — any system can call it
Quality gate	11 automated checks incl. Saudi cultural red lines + length
Validation	Human review by Mohamed — the only trusted quality signal
Status	Foundation tagged v1.0.0. Caption quality: in active improvement.

3. How it works — the six layers

A request flows through six layers. Each adds intelligence the layer below cannot.

Layer	What it does
1. Real data	6,888 verified Saudi posts — captions, likes, visuals, occasion, sector
2. Brain	Aggregated intelligence: brand voice, Saudi dialect rules, occasions, guardrails
3. Templates	Real high-engagement captions, tiered by likes (gold/silver/bronze)
4. CD brains	5 creative-director methodologies route by sector + occasion
5. Engine	Generates the caption: brain context + real templates + CD technique
6. Quality gate	11 checks: Saudi dialect, product names, cultural red lines, length

Every output is grounded in **real Saudi captions** (not invented), shaped by a **named creative methodology** (not a generic prompt), and screened by a **cultural gate** that hard-blocks anything outside Saudi norms.

4. Why it matters

- **Proprietary & defensible.** The data is owned, verified, and grows with every extraction. It is the difference between a fal.ai wrapper and a real platform.
- **Culturally correct by design.** Saudi dialect (not Gulf-generic), Saudi occasions, and hard cultural red lines are built in — not bolted on.
- **Proof-first.** Every caption can show which real post it learned from, and that post's real likes. Answers the 'is the data fake?' question directly.
- **Two pipelines.** Self-service for SMEs (Pipeline A) and managed AI-creative for enterprise brands (Pipeline B).

5. How it works with any system

The platform is **file-first and API-exposed**, so it plugs into anything:

- **Files are the source of truth.** The whole knowledge base is versioned JSON/YAML in Git — portable, auditable, syncable to any database (Postgres today).
- **One HTTP call.** POST /api/create {brand, product, occasion} returns caption + creative direction + proof. Any app, CMS, or bot can integrate in minutes.
- **Model-agnostic.** The intelligence lives in the data + methodology, not the model. We proved a cheap model + good knowledge matches an expensive one.
- **Self-documenting.** A 24/7 daemon keeps system state fresh; the knowledge map is readable by any new engineer or partner.

6. The quality bar we are seeking

A caption is acceptable only when a **Saudi creative director would approve it**. Concretely:

- **Sounds Saudi** — real Najdi/Hejazi dialect markers, never Gulf-generic or stiff MSA.
- **Culturally safe** — passes hard red lines (no clothing/veil removal, no bedroom scenes, no exploiting vulnerability).
- **Short & coherent** — one or two sentences, no rambling. Length capped per sector.
- **On-brand & on-occasion** — correct product name, brand voice, occasion keywords.
- **Genuinely creative** — applies a real creative technique, not generic marketing copy.

7. Honest status

The **foundation is strong** (data, brain, templates, API, cultural gate). Caption **creative quality is not yet at the bar** — validated by human review: in a blind rating of 30 captions, only 5 were approved. We learned that automated AI scoring is unreliable for Saudi cultural quality, so **human review is now the single source of truth**. The next phase is a focused push on caption quality — see the companion Consultation Brief.
